⚠ Safety Precautions

- Important Notes on exporting this product or equipment containing this product;
  If the end-user or application of this product is related to military affairs or weapons, its export may be controlled by “Foreign Exchange and Foreign Trade Control Law” of Japan where export license will be required before product can be exported from Japan.
- This product is designed and manufactured for use in General Purpose Industrial Equipment and it is not intended to be used in equipment or system that may cause personal injury or death.
- All servicing such as installation, wiring, operation, maintenance and etc., should be performed by qualified personnel only.
- Tighten mounting screws with an adequate torque by taking into consideration strength of the screws and the characteristics of material to which the product will be mounted. Over tightening can damage the screw and/or material; under tightening can result in loosening.
- Install safety equipment to prevent serious accidents or loss that is expected in case of failure of this product.
- Consult us before using this product under such special conditions and environments as nuclear energy control, aerospace, transportation, medical equipment, various safety equipments or equipments which require a lesser air contamination.
- We have been making the best effort to ensure the highest quality of our products, however, some applications with exceptionally large external noise disturbance and static electricity, or failure in input power, wiring and components may result in unexpected action. It is highly recommended that you make a fail-safe design and secure the safety in the operative range.
- If the motor shaft is not electrically grounded, it may cause an electrolytic corrosion to the bearing, depending on the condition of the machine and its mounting environment, and may result in the bearing noise. Checking and verification by customer is required.
- Failure of this product depending on its content may generate smoke of about one cigarette. Take this into consideration when the application of the machine is clean room related.
- Please be careful when using the product in an environment with high concentrations of sulfur or sulfuric gases, as sulfuration can lead to disconnection from the chip resistor or a poor contact connection.
- Do not input a supply voltage which significantly exceeds the rated range to the power supply of this product. Failure to heed this caution may lead to damage of the internal parts, causing smoke and/or fire and other troubles.
- The user is responsible for matching between machine and components in terms of configuration, dimensions, life expectancy, characteristics, when installing the machine or changing specification of the machine. The user is also responsible for complying with applicable laws and regulations.
- Manufacturer’s warranty will be invalid if the product has been used outside its stated specifications.
- Component parts are subject to minor change to improve performance.
- Read and observe the instruction manual to ensure correct use of the product.

Repair	Consult to the dealer from whom you have purchased this product for details of repair work. When the product is incorporated to the machine you have purchased, consult to the machine manufacturer or its dealer
URL	Electronic data of this product (Instruction Manual, CAD data) can be downloaded from the following web site; https://industry.panasonic.com/global/en/

Specification part

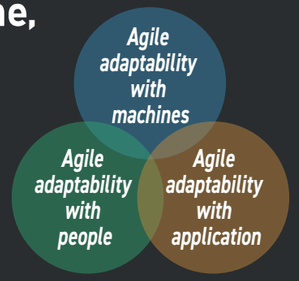
IN Better Solution

● This product is for industrial equipment. It cannot be used at general home.

2025.4

Agile Adaptability

Elevating agile adaptability with man, machine, and application, improves productivity.



Basic performance to further enhance machine performance

Achieves the industry's best motion performance *.
Faithful to the directive, further strong against disturbances.

*As of September 2023, according to our company investigation.

"Optimization of human and machine work by improving servo intelligence"

By making the servo intelligent, makes the setups that has taken man-hours easier by automatic tuning function, expansion of maintenance function, and application optimization.
Improves productivity enhancing agile adaptability of people, machinery, and application.

MINAS A7

Agile adaptability with machines

Immediate response to commands and disturbances

Moves faithfully to commands and immediately corrects for disturbances with the industry's highest *1 motion performance,.

*1 As of September 2023, according to our company investigation.

Encoder resolution : **27 bit** , Speed response frequency : **4.0kHz or higher**,
Maximum motor speed : **7150r/min** *2 *2 For MHMG022

Agile adaptability with people

Immediate response both at startup and in case of trouble

Automatic tuning function is expanded from simple start-up to automation of craftsmanship.

Ultra-high precision **preciAIse TUNING** High precision **One Minute TUNING**
Immediate finishing **TUNINGLESS**

Agile adaptability with application

Immediate adaptation to specific application

Controllerless with optimal application functions.
Improves system response by direct sensor feedback control completed in driver.

Displacement control
Pressure control Under development
High precision gantry control Under development

SERVO MOTOR

High inertia

MHMG

- 50 W to 1.0 kW (3000 r/min rated)
- 1.0 kW to 5.0 kW (2000 r/min rated) Under development

Medium inertia

MDMG Under development

- 1.0 kW to 5.0 kW

Low speed large torque

Medium inertia

MGMG Under development

- 850 W to 4.4 kW

Low inertia

MSMG Under development

- 50 W to 5.0 kW

EtherCAT/RTEX Controller

EtherCAT RTEX Realtime Express

Motion Controller

GM1

PLC programming standardized
- EC61131-3 standard compliance, PLCopen, LD/ST/FBD/SFC/IL/CFC

PLC and motion integrated
- Shortest cycle: 500 µs, Multitask control

Expansive communication interface
- RTEX, EtherCAT
- OPC UA server, FTP server
- Ethernet/IP, Modbus, CodesysV3 communication

Support Tools

PANATERM

Servo motor setup support software

It supports the setup of servomotors, setup, test driving, monitoring, maintenance and troubleshooting, with extensive adjustment functions.

Launced soon

Servo motor selection software

This tool is used to select the motor capacity by combination of mechanism elements. Optional items can also be selected.

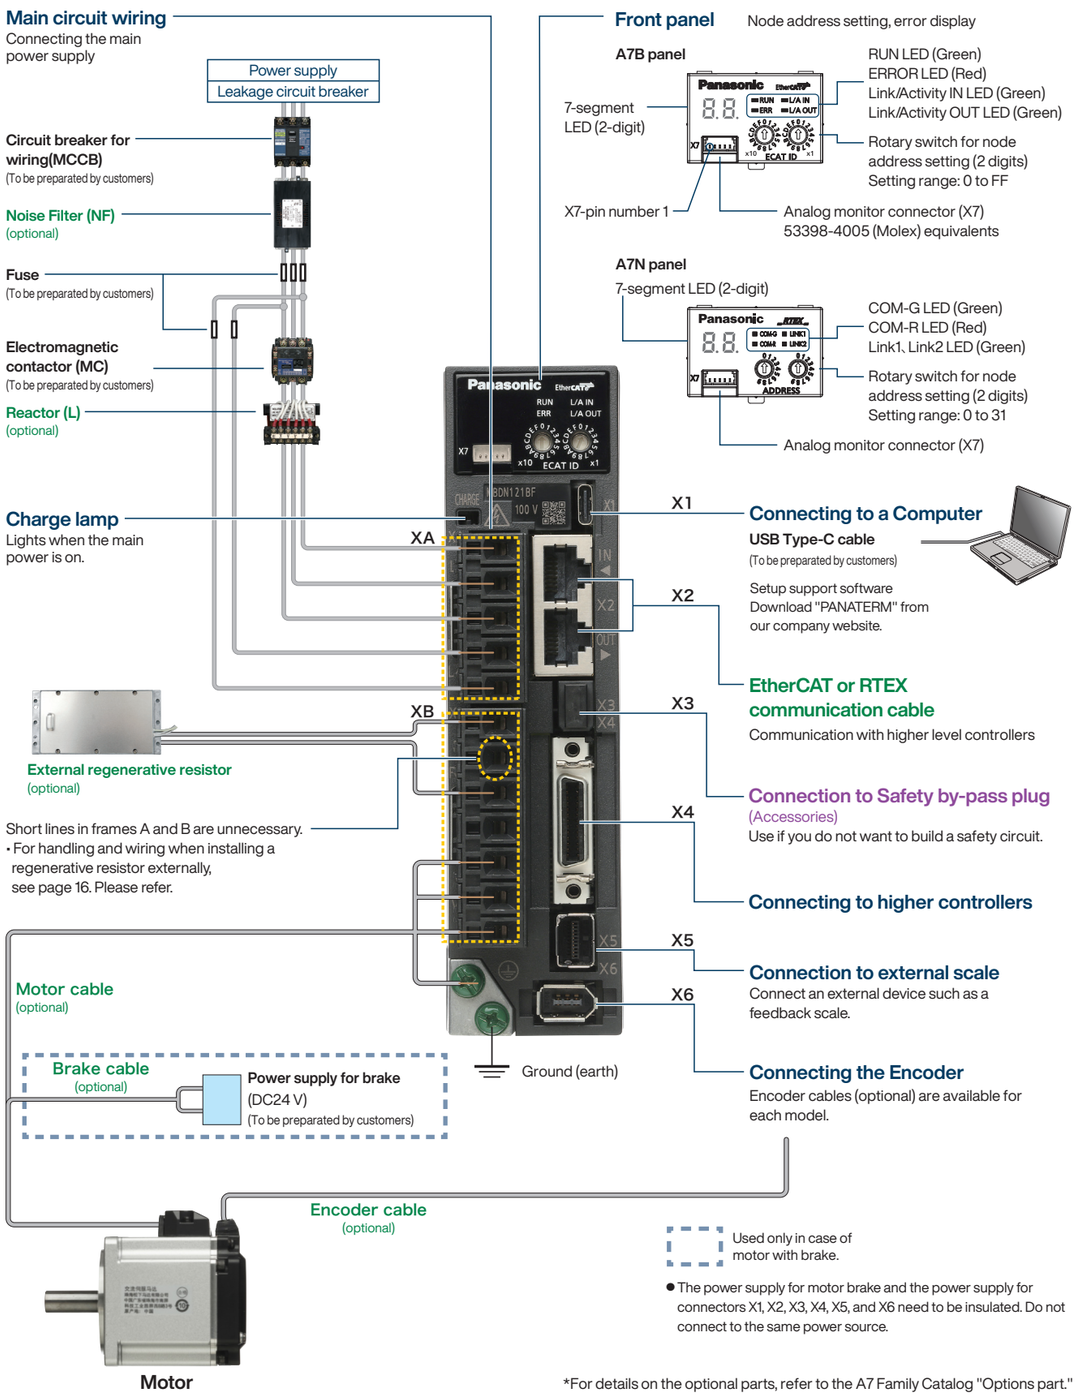
A7B / A7N series (Driver : B frame Motor 200 W)

*The picture is "A7B B frame."



*For details on the optional parts, refer to the A7 Family Catalog "Options part."

<Caution>

Please select the appropriate tightening torque for the product's mounting screws, taking into consideration the strength of the screws used and the material to which they are attached, to avoid loosening or damage.
Example) When tightening steel screws (M5) to steel, 2.7 N·m to 3.3 N·m.

*1 For single phase/three phase 200 V common specifications, select peripheral equipment according to the power supply used.
*2 The electromagnetic contactor used for the external dynamic brake resistor should have the same rating as the electromagnetic contactor used for the main circuit.
*3 Use the same crimp terminal for the ground screw as the crimp terminal for the main circuit terminal block.
*4 Make sure that the thickness of the ground wire and the external dynamic brake resistor wire are the same or larger than the motor wire.
*5 For UL certification, in the case of a single phase power supply, please use a clamp meter that can measure the effective value current and derate the input effective current to 12A or less.
*6 Applicable wire size varies depending on the motor model number. Please check the instruction manual or specifications document for the applicable wire size for each motor model number.
※ Specifications are subject to change due to improvements, etc. Please be sure to obtain the latest information when using these products.

Circuit breakers and electromagnetic contactors

To comply with EU directives/UK standards, be sure to connect an IEC standard and UL certified (LISTED, marked) molded circuit breaker between the power supply and the noise filter.
Make sure that the short-circuit current of the power supply you use is less than 5000 Arms symmetrical current when the product's maximum input voltage is less than that. If the short-circuit current of the power supply exceeds this, install a current-limiting device (current-limiting fuse, current-limiting breaker, transformer, etc.) to limit the short-circuit current.

<Caution>

- Select a molded circuit breaker and noise filter with a capacity commensurate with the power supply capacity (taking load conditions into consideration).

Terminal block and protective ground terminal

- Use copper conductor wires with a temperature rating of 75 °C or higher for wiring.
- For frames A to D, use the included dedicated connectors. In that case, keep the length of the stripped wire between 8 mm and 9 mm.

■Driver: tightening torque
(Connection connector [X4] with ground screw and upper controller)

Driver external frame symbol	Ground screw		Connector to upper controller (X4)	
	Call	Tightening torque(N·m) Note)1	Call	Tightening torque(N·m) Note)1
MADN, MBDN, MCDN, MDDN	M4	0.7 to 0.8	M2.6	0.2 ± 0.05

Note)1 **<Caution>** • Exceeding the maximum tightening torque may cause damage.
• Do not turn on the power while the terminal block screws are loose.
• Turning the power on while the screws are loose may cause smoke or fire.
<Remarks> • Check the tightening torque periodically once a year for looseness.

	Control output	Positioning completion, etc.	
	Command input	EtherCAT command type (smoothing filter available)	RTEX command type (smoothing filter available)
	Basic functions	Rotation direction setting, Command input, Electronic gear, Motor movable range setting, Regenerative resistance setting, Absolute setting, External scale type selection, 2 degrees of freedom control mode	Rotation direction setting, Command input, Electronic gear, Motor movable range setting, Regenerative resistance setting, Absolute setting, External scale type selection, 2 degrees of freedom control mode, Network setting (communication cycle/command update cycle setting)
	Tuning function	Real-time auto-tuning, Adaptive filter, Gain switching, 3rd gain switching, Notch filter, Vibration damping control, Model-type damping filter, Speed feedforward, Torque feedforward, Load fluctuation compensation, Friction torque compensation, Two-stage torque filter, Quadrant glitch compensation, Position command filter, High response current control, Backlash correction	
	Applied function	Pulse regeneration, Deceleration stop, Over traval inhibit(POT, NOT), Deceleration stop, Deceleration stop at Servo-Off, Deceleration stop at main power off, Deceleration stop at alarm, Immediate stop at alarm, Fall prevention at alarm, Fall prevention at Servo-On, Derating, Torque limit switching, Torque saturation protection, Position compare output (A7B only), 1 rotation absolute, Infinite rotation absolute, External scale position information monitor during semi-closed control, Slow stop	
Speed control	Control input	Positive direction over-travel inhibit, Negative direction over travel inhibit, latch signal, etc.	
	Control output	At-Speed, Speed coincidence, etc.	
	Command input	EtherCAT command type	RTEX command type
	Basic functions	Rotation direction setting, Command input, Electronic gear, Regenerative resistance setting, Absolute setting, 2 degrees of freedom control mode, External scale type selection	Rotation direction setting, Command input, Electronic gear, Regenerative resistance setting, Absolute setting, 2 degrees of freedom control mode (speed), External scale type selection, Network setting (communication cycle/command update cycle setting)
	Tuning function	Real-time auto-tuning, Adaptive filter, Gain switching, Notch filter, Torque feedforward, Load fluctuation compensation, Friction torque compensation, Two-stage torque filter, Speed command acceleration/deceleration setting, High-response current control	
	Applied function	Pulse regeneration, Deceleration stop, Over travel inhibit (POT, NOT), Deceleration stop at Servo-Off, Deceleration stop at main power off, Deceleration stop at alarm, Immediate stop at alarm, Fall prevention at alarm, Fall prevention at Servo-On, Derating, Torque limit switching, Torque saturation protection, Position compare output (A7B only), 1 rotation absolute, Infinite rotation absolute, External scale position information monitor during semi-closed control, Slow stop	
Torque control	Control input	Over travel inhibit (positive, negative direction, latch signal, etc.	
	Control output	At-Speed, etc.	
	Command input	EtherCAT command type	RTEX command type
	Basic functions	Rotation direction setting, Command input, Electronic gear, Regenerative resistance setting, Absolute setting, External scale type selection, 2 degrees of freedom control mode, Speed limit	Rotation direction setting, Command input, Electronic gear, Regenerative resistance setting, Absolute setting, External scale type selection, Speed limit, 2 degrees of freedom control mode
	Tuning function	Real-time auto tuning, Gain switching, Notch filter, Two-stage torque filter, High-response current control, Torque feedforward, Friction torque compensation	
	Applied function	Pulse regeneration, Deceleration stop, Deceleration stop at over travel inhibit (POT, NOT), Deceleration stop at Servo-Off, Deceleration stop at main power is off, Deceleration stop at alarm, Immediate stop at alarm, Fall prevention at alarm, Fall prevention at Servo-On, Derating, Torque limit switching, Position compare output, 1 rotation absolute, Infinite rotation absolute, External scale position information monitor during semi-closed control, Slow Stop	Pulse regeneration, deceleration and stop, Deceleration stop, Deceleration stop at over travel inhibit (POT, NOT), Deceleration stop at Servo-Off, Deceleration stop at main power off, Deceleration at alam, Immediate stop at alarm, Fall prevention at alarm, Fall prevention at Servo-On, Derating, 1 rotation absolute, Infinite rotation absolute, External scale position information monitor during semi-closed control, Slow Stop
Full closed control	Control input	Positive direction over travel inhibit (POT, NOT), Negative direction over travel inhibit (POT, NOT), Latch signal, Near origin, etc.	
	Control output	Positioning complete, At-speed output, Speed matching output, etc.	
	Command input	EtherCAT command type (smoothing filter available)	RTEX command type (smoothing filter available)
	Basic functions	Setting rotation direction, command input, Electronic gear, Motor moving range setting, Regenerative resistance setting, External scale type selection, 2 degrees of freedom control mode, External scale division ratio setting, Hybrid deviation excess setup	Rotation direction setting, Command input, Electronic gear, Motor movable range setting, Regenerative resistance setting, External scale type selection, 2 degrees of freedom control mode, External scale division ratio setting, Hybrid deviation excess setting, Network setting (communication cycle and command update cycle setting)
	Tuning function	Real-time auto tuning, Adaptive filter, Gain switching, Third gain switching, Notch filter, Damping control, Speed feedforward, Torque feedforward, Load fluctuation suppression, Friction torque compensation, Hybrid vibration suppression, Two-stage torque filter, Quadrant glitch compensation, Position command filter, High response current ontrol, Backlash compensation	
	Applied function	Pulse regeneration, Deceleration stop, Deceleration stop at over travel inhibit (POT, NOT), Deceleration Stop at Servo Off, Deceleration stop at main power off, Deceleration stop at Alarm, Immediate stop at alarm, Fall prevention at alarm, Fall prevention at Servo-On, Derating, Torque limit switching, Torque saturation protection, Position compare output (A7B only), External scale position Information monitor during Semi-Close Control	
Common	Safety function	STO	
	Protection function	Protection stop, Warning, Timestamp	

*For a description of each function name (functional terminology), see the following page.
*Each specification is subject to change for improvement. Be sure to obtain the latest manual when actually using this product.

Functional terminology

Class	Function name	Functional overview
Output/Input	Positioning complete output (INP, INP2)	A function for outputting positioning completion output (INP) or positioning completion output 2 (INP2), which is an external output signal, in the positioning completion state.
	At-speed output	A function that outputs an external output signal, the speed reaching output (AT-SPEED) signal, when the motor speed exceeds a set speed.
	Speed coincidence output	A function for outputting the speed coincidence output (V-COIN), which is an external output signal, when the speed command and the motor speed coincide.
Basic	Rotation direction setting	Function to set the direction of motor rotation with respect to the direction of position command, speed command and torque command.
	Command input	Operation commands using RTEX communication commands and EtherCAT communication objects
	Electronic gear	A function that multiplies the position/speed command input from the host device by the electronic gear ratio set in a parameter or object and make it the position/speed command to the position/speed control block.
	Motor movable range setting	A function that generates an alarm and decelerates and stops the motor when the motor position exceeds the movable range.
	Regenerative resistance setting	A function to switch the settings of the regenerative resistance load protection function.
	Absolute setting	A function to set how to use the absolute encoder.
	External scale type selection	A function to select the type of external scale used and set direction reversal for the external scale feedback counter.
	Two-degree-of-freedom control	Expanded function for each control mode that improves responsiveness by allowing command response and servo stiffness to be set independently.
	Speed limit	As a protection during torque control, this function controls the speed so that it does not exceed the speed limit value set during torque control.
	External scale division ratio setting	A function to set the division ratio for encoder resolution and external scale resolution.
	Hybrid deviation excess setting	A function that detects the difference between the motor (encoder) position and the load (external scale) position, and generates hybrid deviation excess error protection when the difference exceeds the allowable value.
	Network setting	Function for setting the RTEX communication cycle and command update cycle.
Tuning	Real-time auto tuning	A function that estimates the load characteristics of a machine in real time and automatically performs basic gain settings and load fluctuation compensation according to stiffness parameters based on the estimation results.
	Adaptive filter	A function that reduces vibration by estimating the resonance frequency from the vibration component that appears in the motor speed under actual operating conditions and removing the resonance component from the torque command.
	Gain switching	A function that switches the gain using a switching command depending on the operating state.
	Third gain switching	A function to set a third gain that switches the gain just before stopping, in addition to the normal gain switching function.
	Notch filter	The function of setting a filter to suppress the resonance peak of the machine.
	Damping control	A function that reduces vibration by removing vibration frequency components from position commands when the tip of the device vibrates or the entire device shakes.
	Model type damping filter	A function that improves the effectiveness of vibration control and reduces vibration by removing anti-resonance frequency components and resonance frequency components when the tip of the device vibrates or the entire device shakes.
	Speed feedforward	A function that increases the responsiveness of position control by reducing position deviation during operation at a constant speed using a speed feedforward value.
	Torque feed forward	A function that increases the response of speed control by using the torque feedforward value to bring the position error closer to 0 during acceleration/deceleration.
	Load fluctuation compensation	A function that suppresses motor speed fluctuations due to disturbance torque and load fluctuations and improves stability.
	Friction torque compensation	A function that reduces the effects of friction that exists in mechanical systems.
	Hybrid vibration suppression	A function that suppresses vibration caused by the twist between the motor and load in full-closed control mode.
	Two-stage torque filter	A function that sets another torque filter to increase the effect of suppressing high-frequency vibration components besides 1'st and 2'nd torque filter.
	Quadrant glitch compensation	A function that suppresses quadrant glitch that occurs during circular interpolation operation on two or more axes.
	Position command filter	A function to smooth the position command after electronic gear.
	Speed command acceleration/deceleration setting	A function that automatically applies acceleration and deceleration to speed control in response to speed command input.
	High response current control	A function that improves the responsiveness of the current control part by changing the current response setting to a value larger than the factory setting.
	Backlash compensation	Function to compensate backlash during position control (including full close control).

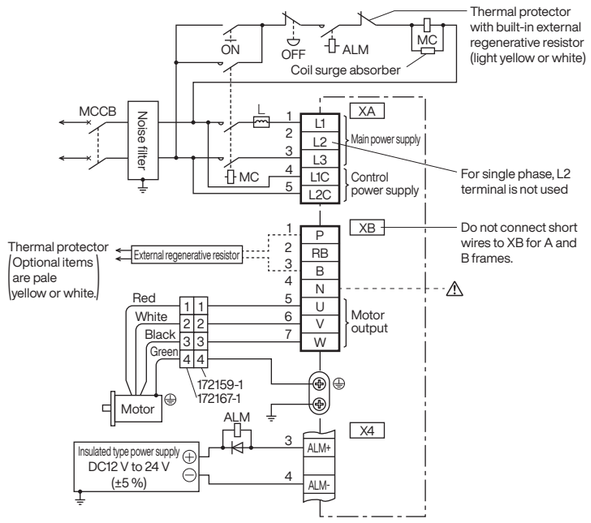
Class	Function name	Functional overview
Application	Torque limit switching	A function that switches the torque limit value according to the operating direction or the torque limit switching command (TL_SW) of RTEX communication.
	Torque saturation protection	A function that generates an alarm when torque saturation continues for a certain period of time.
	Position cmpare output	A function that outputs a pulse signal from the general-purpose output or position compare output terminal when the actual position passes the position set by the parameter.
	1 rotation absolute	A function that allows the absolute encoder to be used as an absolute system with only one revolution.
	Infinite rotation absolute	A function for arbitrarily setting an upper limit value of multiple rotation data of an absolute encoder.
	Pulse regeneration	A function that outputs the actual position movement amount as AB phase pulses.
	Virtual full closed control	A function that virtually estimates the external scale position from encoder position information and allows axis operation to continue.
	External scale position information monitor during semi-closed control	A function to monitor external scale position information using RTEX communication and EtherCAT object during semi-closed control.
	Retracting operation	A function to activate the evacuation operation by turning off the main power or inputting an evacuation operation signal, and to set the operation details.
	Deceleration stop	A function to set the motor deceleration and stop method when the main power is cut off or an alarm occurs.
	Decelaration stop at over travel inhibit input (POT, NOT)	A function to set the operation during deceleration and after stopping after inputting over travel inhibit input (POT, NOT).
	Deceleration stop at Servo-Off	A function to set the stopping method during deceleration at Servo-Off, and the operation after stopping.
	Deceleration stop at main power off	A function to set the stopping method during deceleration and the operation after stopping after the main power is turned off.
	Deceleration stop at alarm	A function to set the stopping method during deceleration at alarm and the operation after stopping.
	Immediately stop when alarm occurs	A function to set the stop action when an immediate stop alarm occurs.
	Fall prevention when alarm occurs	A function that prevents falling at alarm by setting the alarm deceleration stop function to immediate stop.
	Fall prevention at Servo-On	A function that eliminates the delay in the rise of the torque command at Servo-On command input and prevents the device from falling.
	Slow Stop	A function that smoothly stops the motor with Servo-On when the main power is turned off or an alarm occurs with the immediate stop setting.
	Derating	A function to derate the overload characteristics of the servo driver according to the derating magnification set by the parameter.
	Auto focus control	A function that directly inputs the displacement sensor signal to the servo driver to achieve a constant clearance for workpiece that changes in height.
Safety	Safety, STO	A function that cuts off the motor current and turns off the motor output torque by forcibly turning off the drive signal of the power transistor inside the servo driver using a circuit (hardware) from the safety input signal.
Protection	Protection	A function that detects equipment abnormalities and stops the motor to ensure safety.
	Warning	A function that generates a warning before the protection function operates and checks conditions such as overload in advance.
	Timestamp	A function that adds the time alarm occurred to the alarm information, and also adds the measurement time to the waveform information measured using the waveform graphic function provided by the setup support software.

*These descriptions are terminology explanations and are not a list of the actual features included.

Main circuit connection example — Connectors XA, XB, and terminal block connections

For A frame, B frame single phase 100 V, 200 V

●For lead wire type motor

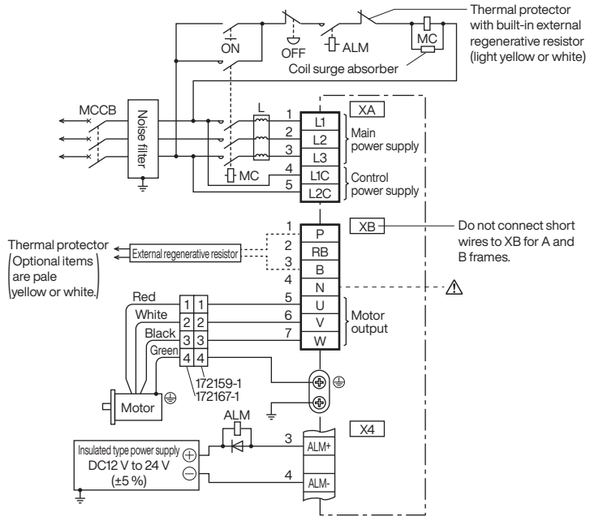


● Pin No. descriptions of X4 are based on shipping parameters.

*The motor brake power supply and connector X4 power supply must be insulated. Do not connect them to the same power source.

For A frame, B frame Three phase 200 V

●For lead wire type motor



● Pin No. descriptions of X4 are based on shipping parameters.

*The motor brake power supply and connector X4 power supply must be insulated. Do not connect them to the same power source.

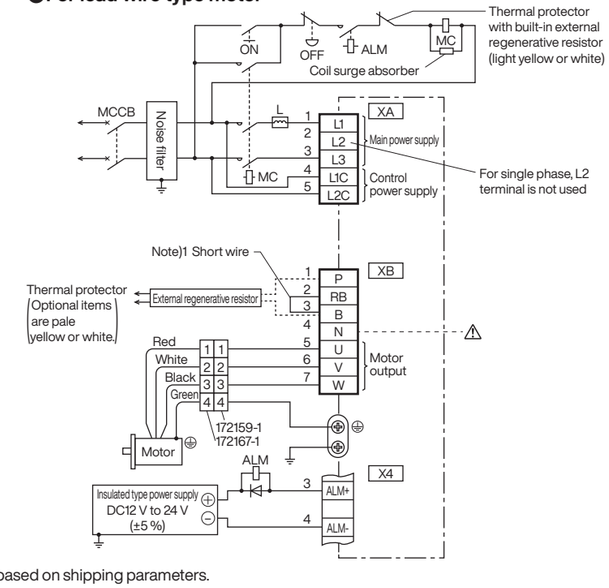
■Connection of the regenerative resistor

Frame type	Short line	Built-in regenerative resistor	Connector XB connection: ⚠ Do not connect anything to "N"	
			When using an external regenerative resistor	When an external regenerative resistor is not used
A frame B frame	None	None	Between P and B: Connect external regenerative resistor	Between P and B: Always open

***For the specifications of the motor side connector, please refer to the A7 Family catalog Options part.**

For C frame, D frame single phase 100 V, 200 V

●For lead wire type motor

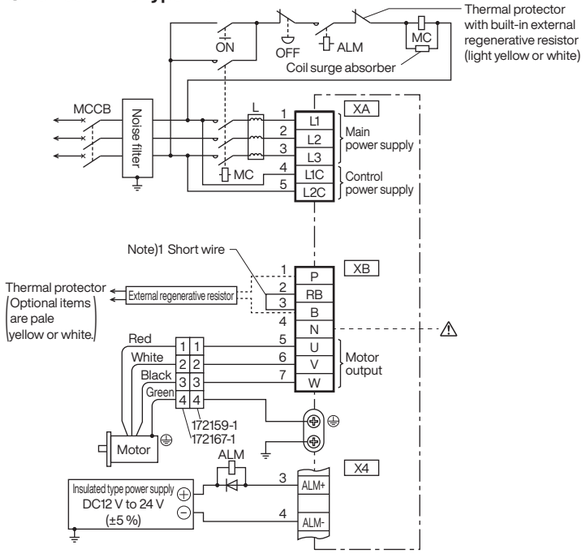


● Pin No. descriptions of X4 are based on shipping parameters.

*The motor brake power supply and connector X4 power supply must be insulated. Do not connect them to the same power source.

For C frame, D frame Three phase 200 V

●For lead wire type motor



● Pin No. descriptions of X4 are based on shipping parameters.

*The motor brake power supply and connector X4 power supply must be insulated. Do not connect them to the same power source.

Note)1

Frame type	Short wire (Accessory)	Built-in regenerative resistor	Connector XB connection: ⚠ Do not connect anything to "N"	
			When using an external regenerative resistor	When an external regenerative resistor is not used
C frame D frame	Yes	Yes	Remove the attached short line between RB and B. Between P and B: Connect external regenerative resistor	Short circuit with attached short wire between RB and B

***For the specifications of the motor side connector, please refer to the A7 Family catalog Options part.**

A safety circuit that controls safety functions is made by connecting the host controller. If you do not want to construct a safety circuit, please use the included safety bypass plug.

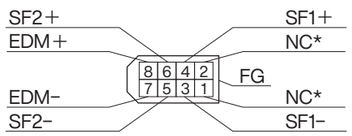
Safety Torque Off (STO) Function Overview

The Safe Torque Off (STO) function uses a safety input signal to forcibly turn off the drive signal of the power transistor inside the servo driver using a circuit (hardware) to cut off the motor current and output torque.
When the STO function is activated, the servo driver turns off the servo ready output signal (S-RDY) and enters the STO state, and "St" is displayed on the front panel. Also, when the STO input is released and the Servo-On input is turned off (OFF), the state automatically transitions to the Servo-Off state.

Safety precautions

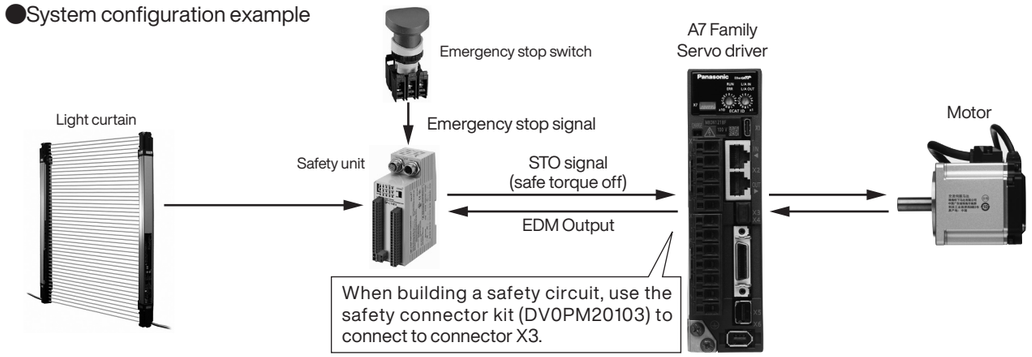
- When using the STO function, be sure to perform a risk assessment on the device and confirm that the system satisfies the safety requirements. If the product is used in conditions that do not meet the safety requirements, it may lead to personal injury.
- Even when the STO function is working, the following dangers still exist, so be sure to consider safety in your risk assessment. Incorrect use may result in personal injury.
  - If there is an external force (such as gravity on a vertical axis), the motor will move. If holding is required, use a separate external brake or other means. Please note that the brake of a servo motor with a brake is only for holding and cannot be used for braking purposes.
  - Furthermore, even if there is no external force, if parameter Pr5.10 "Sequence at alarm" is set to free run (dynamic brake disabled), the motor will free run and the stopping distance will be longer. Please do not let this become a problem.
  - Due to a power transistor failure, etc., the motor may move within a range of up to 180 electrical degrees. Please do not let this become a problem.
  - The STO function cuts off power to the motor, but does not cut off power to the servo driver and does not provide electrical isolation. When performing maintenance on the servo driver, take other measures such as cutting off the power to the servo driver.
- EDM output signals are not safety outputs. Do not use it for any purpose other than the failure monitoring function. Incorrect use may result in personal injury.
- The STO status monitor output signal is not a safety-related part. When designing the system, make sure to avoid dangerous conditions even if the STO condition monitor output signal cannot be output normally. Incorrect use may result in personal injury.
- The dynamic brake and external brake release signal outputs are not safety-related parts. Make sure that the system design avoids dangerous conditions even if the external brake release fails during STO conditions. Incorrect use may result in personal injury.
- When using the STO function, connect equipment that complies with safety standards. Use of equipment that does not meet safety standards may result in personal injury.

[Pin arrangement]
(View from the cable side)

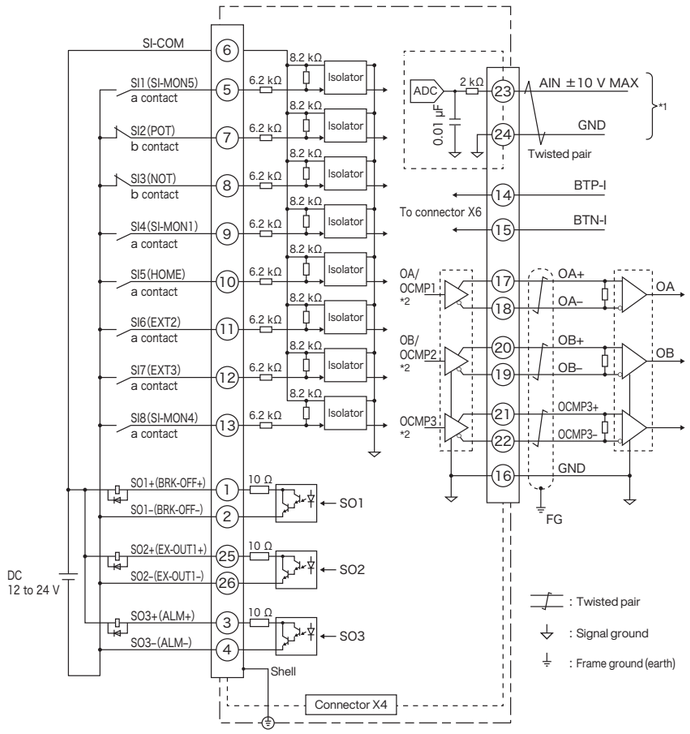


*Do not connect anything to the NC.

●System configuration example



Connector X4 connection



The following pins can be switched by parameters.
Input : 5, 7, 8, 9, 10, 11, 12, 13
OutPut : 1, 2, 3, 4, 25, 26
*The above figure is based on the factory setting parameters.

*1 Can only be used with the application-sprcialized type (special order product). Do not use standard products.
*2 Position compare output is set with parameter Pr4.47.

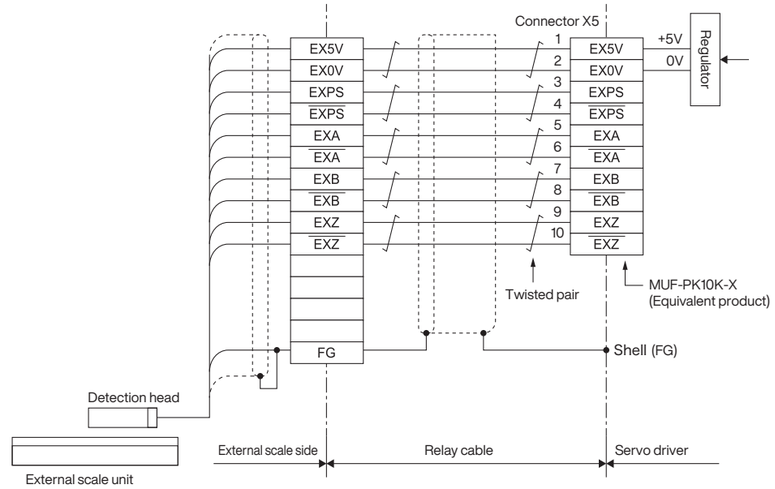
<Note> For connection connectors, please refer to the A7 family catalog Options part.
The circuit diagram above shows the pin functions (factory settings) of the RTEX compatible servo driver (A7N).
Please refer to the table on the right for the pin functions (factory settings) of the EtherCAT compatible servo driver (A7B).

● Pin function factory setting

	Servo driver with RTEX (A7N)		Servo driver with EtherCAT (A7B)	
Pin number	Pin function	Signal	Pin function	Signal
6	SI-COM	General purpose input common	SI-COM	General purpose input common
5	SI-MON5	General monitor Input 5	SI-MON5	General monitor Input 5
7	POT	Qazzqazz-0	POT	Qazzqazz-0
8	NOT	Negative direction over travel inhibit input	NOT	Negative direction over travel inhibit input
9	SI-MON1	General monitor Input 1	HOME	Near origin input
10	HOME	Near origin input	EXT1	External latch input 1
11	EXT2	External latch input 2	EXT2	External latch input 2
12	EXT3	External latch input 3	SI-MON3	General monitor Input 3
13	SI-MON4	General monitor Input 4	SI-MON4	General monitor Input 4
1	BRK-OFF+	External brake release signal	BRK-OFF+	External brake release signal
2	BRK-OFF-		BRK-OFF-	
25	EX-OUT1+	General output 1	EX-OUT1+	General output 1
26	EX-OUT1-		EX-OUT1-	
3	ALM+	Servo alarm output	ALM+	Servo alarm output
4	ALM-		ALM-	
23*1	AIN	±10 V max Analog input	AIN	±10 V max Analog input
24*1	GND	Ground	GND	Ground
14	BTP-I	Battery input for absolute encoder	BTP-I	Battery input for absolute encoder
15	BTN-I		BTN-I	
17	OA+	A-phase output	OA+	A-phase output
18	OA-		OA-	
20	OB+	B-phase output	OB+	B-phase output
19	OB-		OB-	
21	—	—	—	—
22	—		—	
16	GND	Ground	GND	Ground

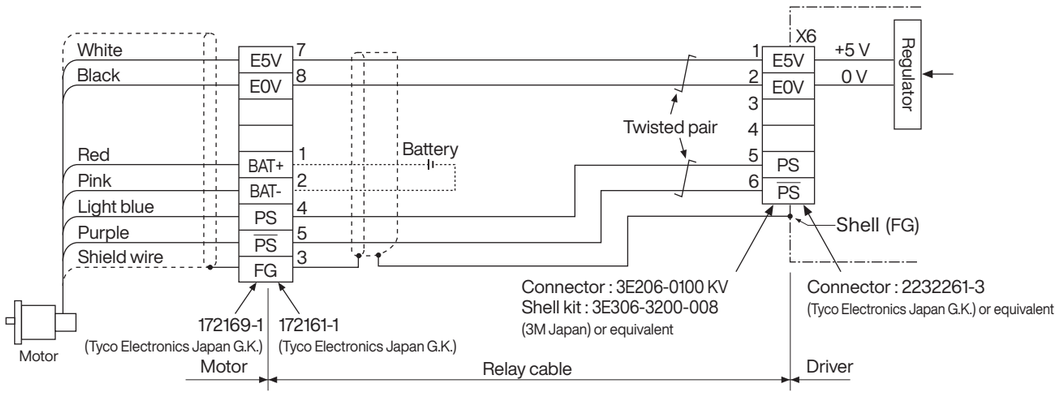
The factory settings for pins 9, 10, and 12 are different between the RTEX compatible driver (A7N) and the EtherCAT compatible driver (A7B).

Connector X5 connection



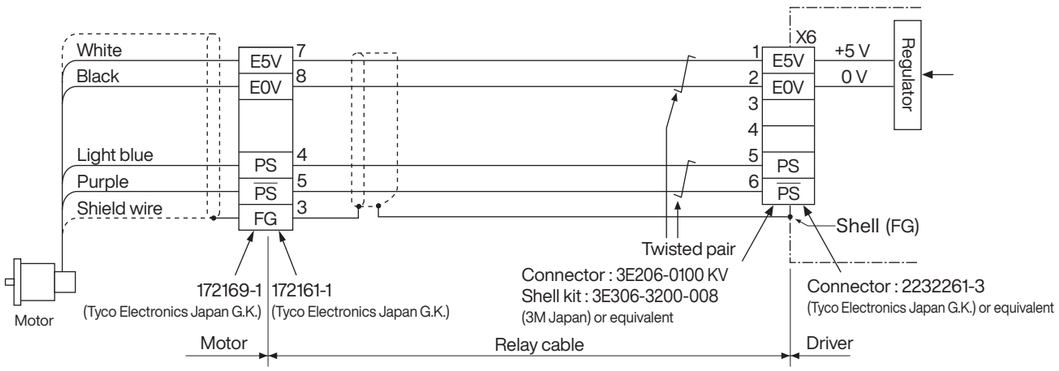
When using a 27 bit absolute encoder as absolute system*

*When using multi-turn data



When using a 27 bit absolute encoder as an incremental system*

*Without Multi-turn data



MEMO

Driver external dimensions

*All descriptions are for the A7B series, but the external dimensions of the A7N series are the same. Refer to page 10 for more details.

*Specifications are subject to change due to improvements, etc. Please be sure to obtain the latest information when using this product. *Dimensions are subject to change, so if you are using it for design purposes, please inquire for confirmed dimensions. Before using the product, be sure to read the "Instruction Manual" and carefully check the precautions to ensure proper use.

Note: If high-speed response is required, lower the load inertia ratio to rotor inertia moment.
Dimensions are subject to change, so if you are using it for design purposes, please inquire for final dimensions.
Before using the product, be sure to read the "Instruction Manual" and carefully check the precautions to ensure proper use.

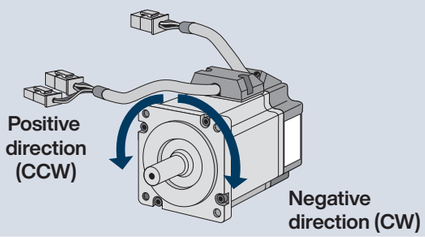
Environmental condition

Item		Conditions
Operating temperature *1		0 °C to +60 °C (No freezing) (The rating will be derated if the temperature exceeds 40°C for models without oil seal, and if the temperature exceeds 20°C for models with oil seal. *3)
Operating Humidity		20 %RH to 85 %RH (No condensation *4)
Storage temperature *2		−20 °C to 65 °C (Guaranteed maximum temperature: 80 °C : 72 hours cumulatively. No condensation *4)
Storage humidity		20 %RH to 85 %RH (No condensation *4)
Vibration resistance	Motor only	49 m/s² (5 G) or less when rotating, 24.5 m/s² (2.5 G) or less when stopped
Shock Resistant	Motor only	98 m/s² (10 G) or less
Protection class (motor only)		IP65 *5 (Excluding output shaft rotating part and connector part)
Altitude		Less than 2000 m above sea level. However, if exceeds 1000 m, please use the reduced rating shown on the right. 
*1 The operating temperature is the temperature 5 cm away from the motor.
*2 This is allowable temperature for short periods of time, such as during transportation.
*3 For derating, refer to 2.2.4 (Specifications) in the Instruction Manual (General).
*4 Please note that as the temperature decreases, the humidity increases, making condensation more likely to occur.
*5 This motor complies with the test conditions stipulated by EN standards (EN60529, EN60034-5). It cannot be applied to applications that require long-term waterproof performance, such as constant washing with water.

<Note>

The initial settings for the rotation direction are defined as positive direction (CCW) and negative direction (CW). please note.



About the notes on the "Motor specifications" page

Note)1 A and B frame drivers do not have a built-in regenerative resistor. If regeneration occurs, please prepare an optional external regenerative resistor.

● At 100 V AC power supply

The regenerative braking frequency indicates the allowable frequency when the motor decelerates to a stop from its rated speed.

- When a load is applied, the value in the table becomes 1/(m + 1). (m = load inertia/rotor inertia)
- The frequency of regenerative braking when the rated rotational speed is exceeded is inversely proportional to the square of (operating speed/rated speed).
- The power supply voltage is 115 VAC (at 100 VAC power supply). When the power supply voltage fluctuates, it is inversely proportional to the square of (operating power supply voltage/115) with respect to the value in the table.
- Please contact us if the operating rotation speed changes frequently or if the machine is constantly regenerating, such as in vertical feed.

● At 200 V AC power supply

The regenerative braking frequency indicates the allowable frequency when the motor decelerates to a stop from its rated speed.

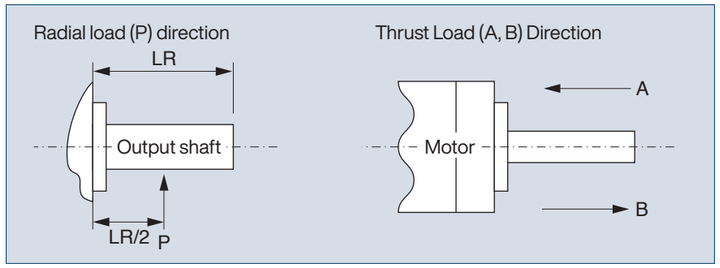
- When a load is applied, the value becomes 1/(m + 1) of the value in the table. (m = load inertia/rotor inertia)
- The frequency of regenerative braking when the rated rotational speed is exceeded is inversely proportional to the square of (operating speed/rated speed).
- The power supply voltage is 230 VAC (when using a 200 VAC power supply). When the power supply voltage fluctuates, it is inversely proportional to the square of (operating power supply voltage/230) with respect to the value in the table.
- Please contact us if the operating rotation speed changes frequently or if the machine is constantly regenerating, such as in vertical feed.

Note)2 There are no restrictions on the regeneration frequency as long as the effective torque is within the rated torque.
Note)3 Please contact us if the load inertia ratio exceeds the listed value.
Note)4 The release time is the value for DC switching using a varistor.

Allowable load of the output shaft

Radial load" refers to the load applied to the output shaft in the radial direction. This occurs when the other machine is connected with a chain or belt, but does not occur when it is directly connected to a coupling. As shown in the figure below, the allowable value is set by the load applied to the LR/2 position of the output shaft. Also, thrust load refers to the load applied to the output shaft in the thrust direction.

Radial load and thrust load greatly affect the life and strength of the bearing, so please be careful that the load during operation does not exceed the allowable radial load and allowable thrust load listed on each page.



Motor built-in holding brake

It is used to hold the workpiece (movable part) from falling due to gravity when the power to the driver is cut off, such as in applications where a motor drives a vertical axis.

The built-in brake of the motor is only used for "holding" purposes to maintain a stopped state. Do not use it for "braking" to stop a moving load.

● BRK-OFF signal output timing

- For information on the timing of releasing the brake when the power is turned on, the braking timing at Servo-Off or alarm while the motor is rotating, etc., please download the instruction manual from our website and refer to it.
- When the servo is turned off while the motor is rotating, or when an alarm occurs, the time from when the motor becomes free from the excited state until the BRKOFF signal turns off (brake operates) can be set in Pr4.38 (mechanical brake operation setting during operation). For more information, please download and refer to the instruction manual from our website.

<Note>

1. When operating a motor with a built-in brake, brake lining noise (rattle, etc.) may occur, but this does not affect functionality.
2. When the brake coil is energized (brake is open), leakage magnetic flux may occur from the shaft end, etc. Please be careful when using magnetic sensors etc. near the motor.

● Motor built-in holding brake specification

Motor series	Motor output	Static friction torque N·m	Suction time ms	Release time ms	Excitation current DC A (cold)	Release voltage DC V / Excitation voltage DC V	Allowable work amount per braking J	Allowable total work amount ×10³ J	Allowable angular acceleration rad/s²
MHMG (80 mm sq. or less)	50 W, 100 W	0.38 or more	35 or less	20 or less	0.30	1 or more / 24±2.4	39.2	4.9	30000
	200 W, 400 W	1.6 or more	50 or less		0.36		105	44.1	
	750 W, 1000 W	3.8 or more	70 or less		0.42		185	80	

- The suction time and release time represent the delay time of brake activation.
- The release time is the value for DC switching using a varistor.
- The above figures are representative characteristics(Static friction torque, release voltage and excitation voltage are excluded.)
- The backlash of the built-in holding brake is 2° or less when shipped.
- The lifespan of acceleration/deceleration times based on the above allowable angular acceleration is 10 million times (the number of accelerations/decelerations until the brake backlash suddenly changes)
- Supply power for the motor brake from a power source different from the power source for driver connectors X1, X2, X3, X4, X5, and X6.

Compliance with EU Directives/UK Standards/UL Standards/KC

About EU Directives/UK Standards

EU Directives/UK Standards apply to all electronic products exported to the European Union (EU) that have specific functionality and are sold directly to consumers. Products must comply with unified safety standards and must be affixed with the CE marking, which indicates compliance.
At our company, we have achieved compliance with the relevant standards of the EU Low Voltage Directive/UK Low Voltage Regulation, in order to facilitate the compliance of the machines and equipment that are incorporated with the EU Directives.

Compliance with EU EMC Directive/UK EMC Regulations

For our servo systems, we determine the model (conditions) such as the installation distance and wiring between the driver and motor, and use that model to comply with the relevant standards of the EU EMC Directive/UK EMC Regulation. When installed in an actual machine or device, wiring conditions, grounding conditions, etc. may not be the same as the model. For this reason, in order to ensure that machinery and equipment comply with the EU EMC Directive/UKEMC Regulations (especially regarding unnecessary radiation noise and noise terminal voltage), it is necessary to measure the final machinery and equipment that incorporates the driver and motor.

Compliance with UL standards

By complying with the installation conditions ① and ② below, it becomes a UL61800-5-1 (File No. E164620) standard certified product.

① Use the driver under the environment of pollution degree 2 as specified in IEC60664-1 (e.g. installing inside IP54 control panel).

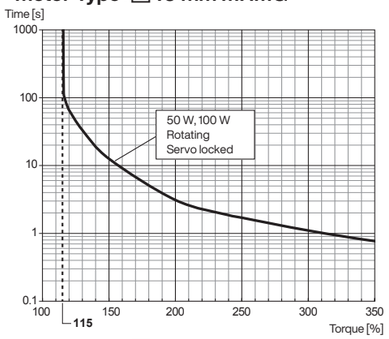
② Be sure to connect a UL-certified (LISTED, Ⓤ marking) wiring circuit breaker and a UL-certified (LISTED, Ⓤ marking) fuse between the power supply and the noise filter. For the rated current of the wiring circuit breaker/fuse, refer to "List of applicable peripherals" on page 11. For wiring, use copper conductor wire with a temperature rated of 75℃ only.

③ Overload protection level

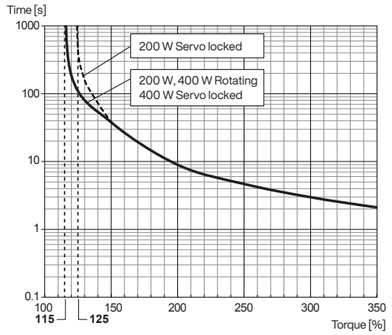
Overload protection level The overload protection function operates based on the motor's time limit characteristics when the effective current reaches or exceeds 115% of the rated current.

■ Overload protection time characteristic

・Motor Type：□40 mm MHMG



・Motor Type：□60 mm MHMG



・Motor Type：□80 mm MHMG
